

# Advisory Service | NHS

## Introduction

The transition to Windows 11 is a key component of digital transformation within the NHS, offering a platform to improve patient care, enable clinical mobility, and secure sensitive patient data.

A successful migration is an opportunity to improve clinical outcomes. Without a clear, structured plan, it can introduce significant operational risk and cause disruption to critical clinical services.

Forward-thinking NHS Trusts are already preparing for the future by:

- Maximising capital investment and delivering value-for-money across the estate.
- Strengthening data security to meet DSPT requirements and aligning with Zero Trust principles.
- Equipping clinicians and support staff with technology that improves patient outcomes.

**Our Windows 11 Advisory service is designed to guide your Trust through the critical decisions that shape a compliant, secure, and successful migration.**

## Talk to our Consultants about...

### Device

Our SMART Device Refresh service provides actionable insights to deliver value-for-money across your Trust's device estate. By balancing performance, clinical requirements, and cost-efficiency, we help you extend device lifecycles, reduce expenditure, and make smarter, data-driven refresh decisions to improve device uptime in critical care environments.

### Security

Avoid the significant cost and security risks associated with Windows 10 Extended Security Updates (ESU). Our consultations help you optimise your investment by applying Zero Trust security principles to protect patient data, strengthening your Trust against cyber threats and ensuring alignment with the DSPT and NHS cyber security standards.

### Applications

We help you manage the complex lifecycle of your clinical applications to lower operational expenses and ensure compliance with security standards. Our service is designed to mitigate compatibility issues with critical systems, including legacy software and Electronic Patient Records (EPRs), that can hinder operating system upgrades and create risk.

### DMaaS

Our DMaaS offering is a fully managed solution designed to reduce the burden of asset management on your digital services team. This allows your internal experts to focus on high-value clinical transformation projects, while we enhance the quality and responsiveness of IT support for your frontline staff.

### Adoption

To realise the full value of your investment, clinicians must be equipped to use new tools with confidence. We help your Trust adopt the latest Windows 11 features in a way that minimises disruption to clinical workflows and improves productivity, freeing up valuable time for patient-facing activities.

## Highlights

- > **Simplify:**  
Migration strategy grounded in data and insight.
- > **Enable:**  
Navigate complexity with expert-led planning.
- > **Enhance:**  
Application security and lifecycle.
- > **Empower:**  
Employee experience with adoption
